SCHATZ GRID VISUALIZATION AND ANALYTICS CENTER (SGVAC)

Pre-operational development, evaluation and demonstration of situational awareness technologies for Transmission & Distribution

Benefits:

Test and validate before implementation

Evaluate technology with real-world data

Test “control center of the future” functionalities

Quickly stand-up pilot assessments

Collaborate with industry partners

Train control center operators

SGVAC FOCUS AREAS

Big Data Analytics & AI

Cybersecurity Solutions

Control Center of the Future Functionalities

New Visualization Approaches

DERMS Platform Evaluation

Modeling & Simulation

Synchrophasors

OPERATOR TRAINING WITH RTDS

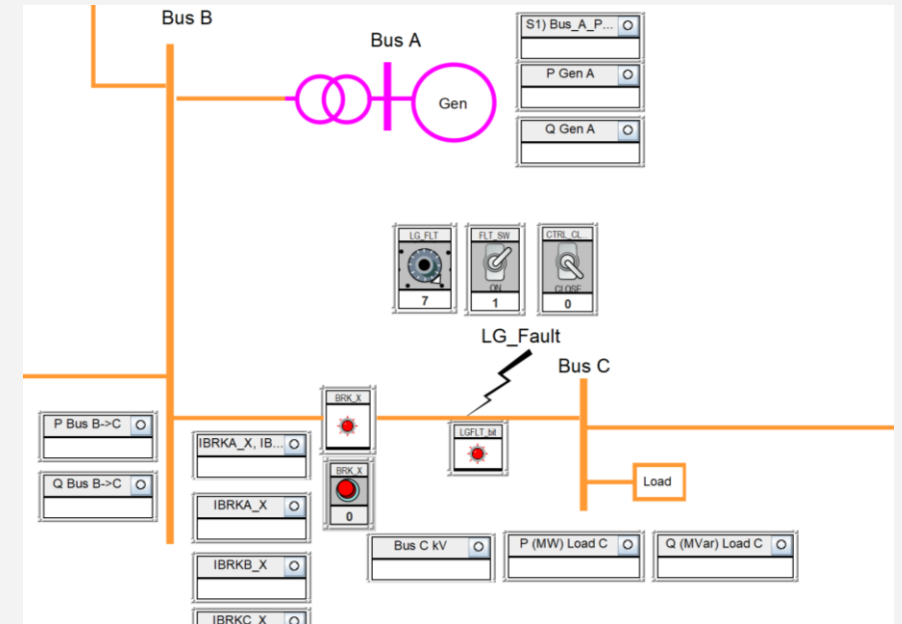

- Goal
 - Evaluate the feasibility of leveraging RTDS for transmission operator training
- Motivation
 - Supplement current training capabilities
 - New phenomena due to changing energy landscape
 - Develop models with more realistic system responses to contingency events and operator actions
 - Generate displays that replicate the operator user interfaces

PROCESS

- Coordinated with our internal training team to determine simulation scenarios of interest
- Created models based on our PSS/E transmission model
- Appropriately scaled simulations for study scenarios
- Developed training views in RSCAD runtime

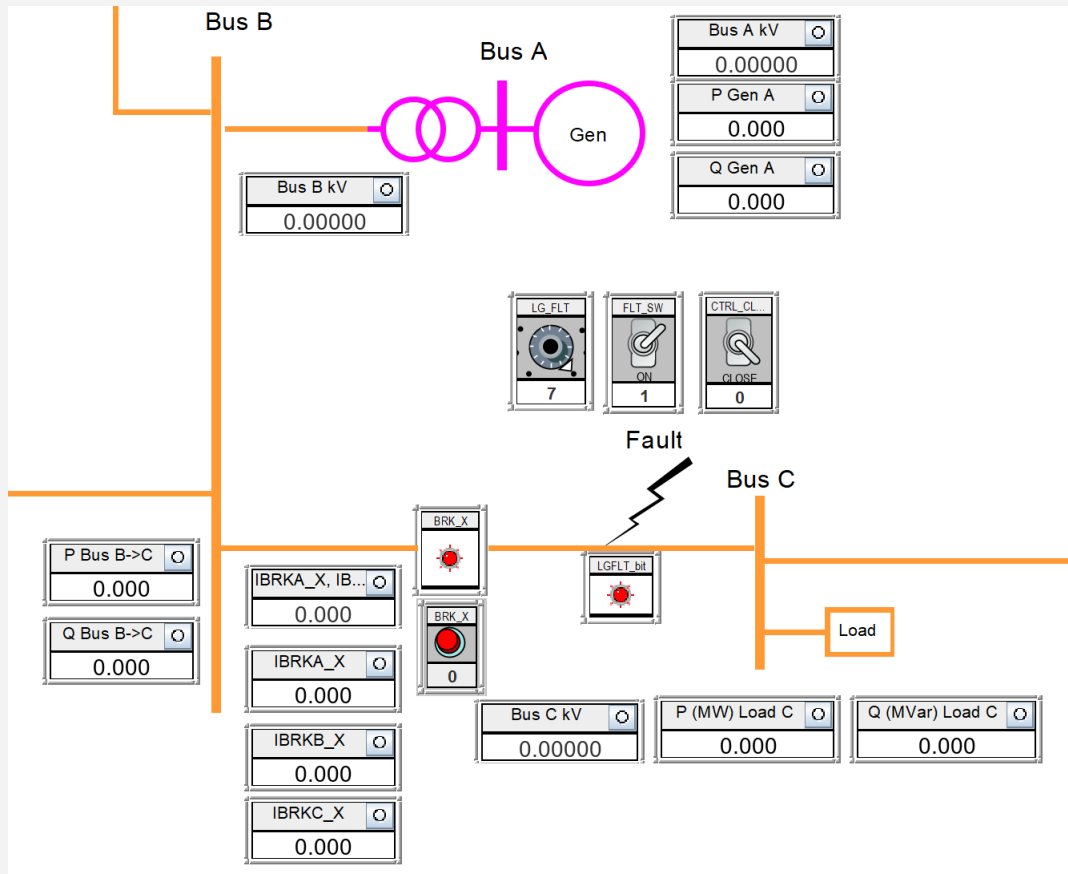

TRAINING SETUP

- Screens
 - Trainer screens show everything including controls to initiate events
 - Trainee screens show a limited number of controls and meters
- Training
 - Trainees are provided a runtime file for the specified scenario
 - Trainers implement events
 - Trainees identify the event and resolve the situation

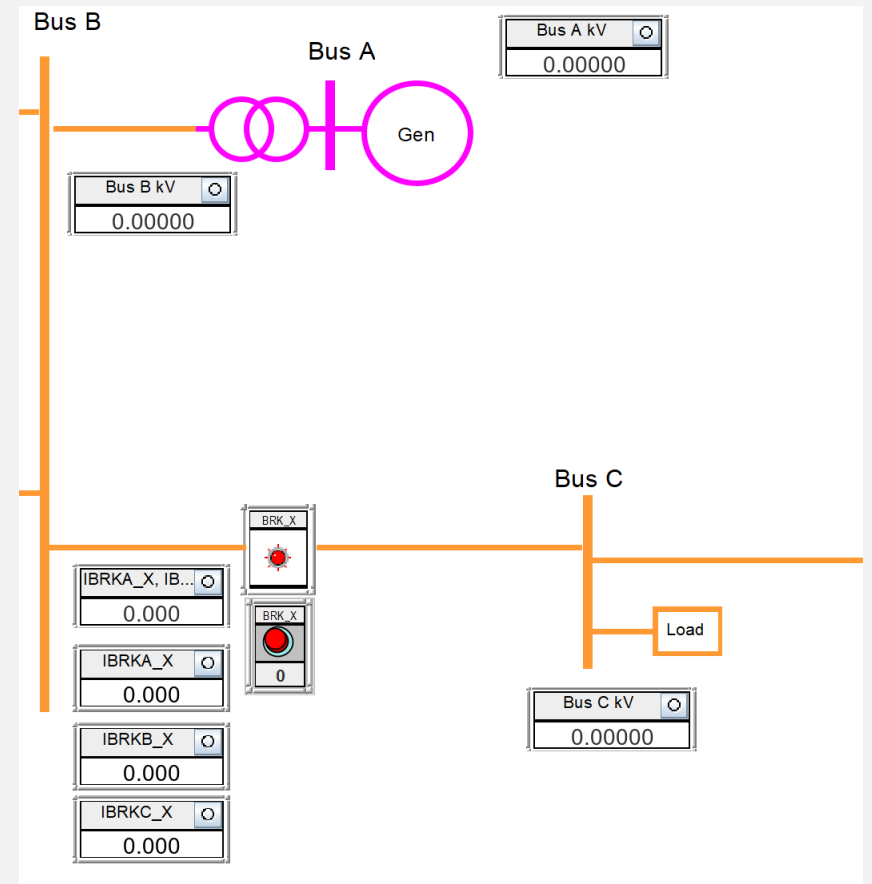

Example of trainer screen

TRAINER VS TRAINEE VIEW

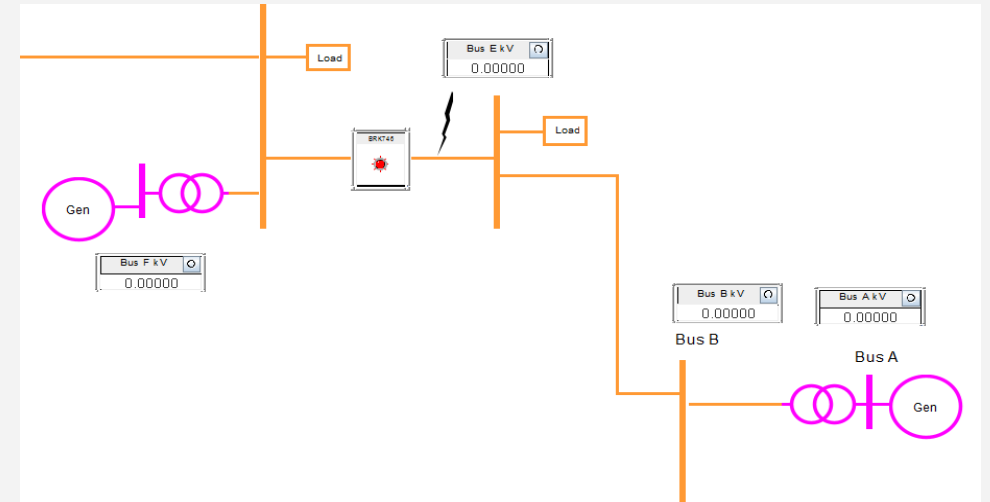

Trainer screen

Trainee screen

TRAINING SCENARIOS

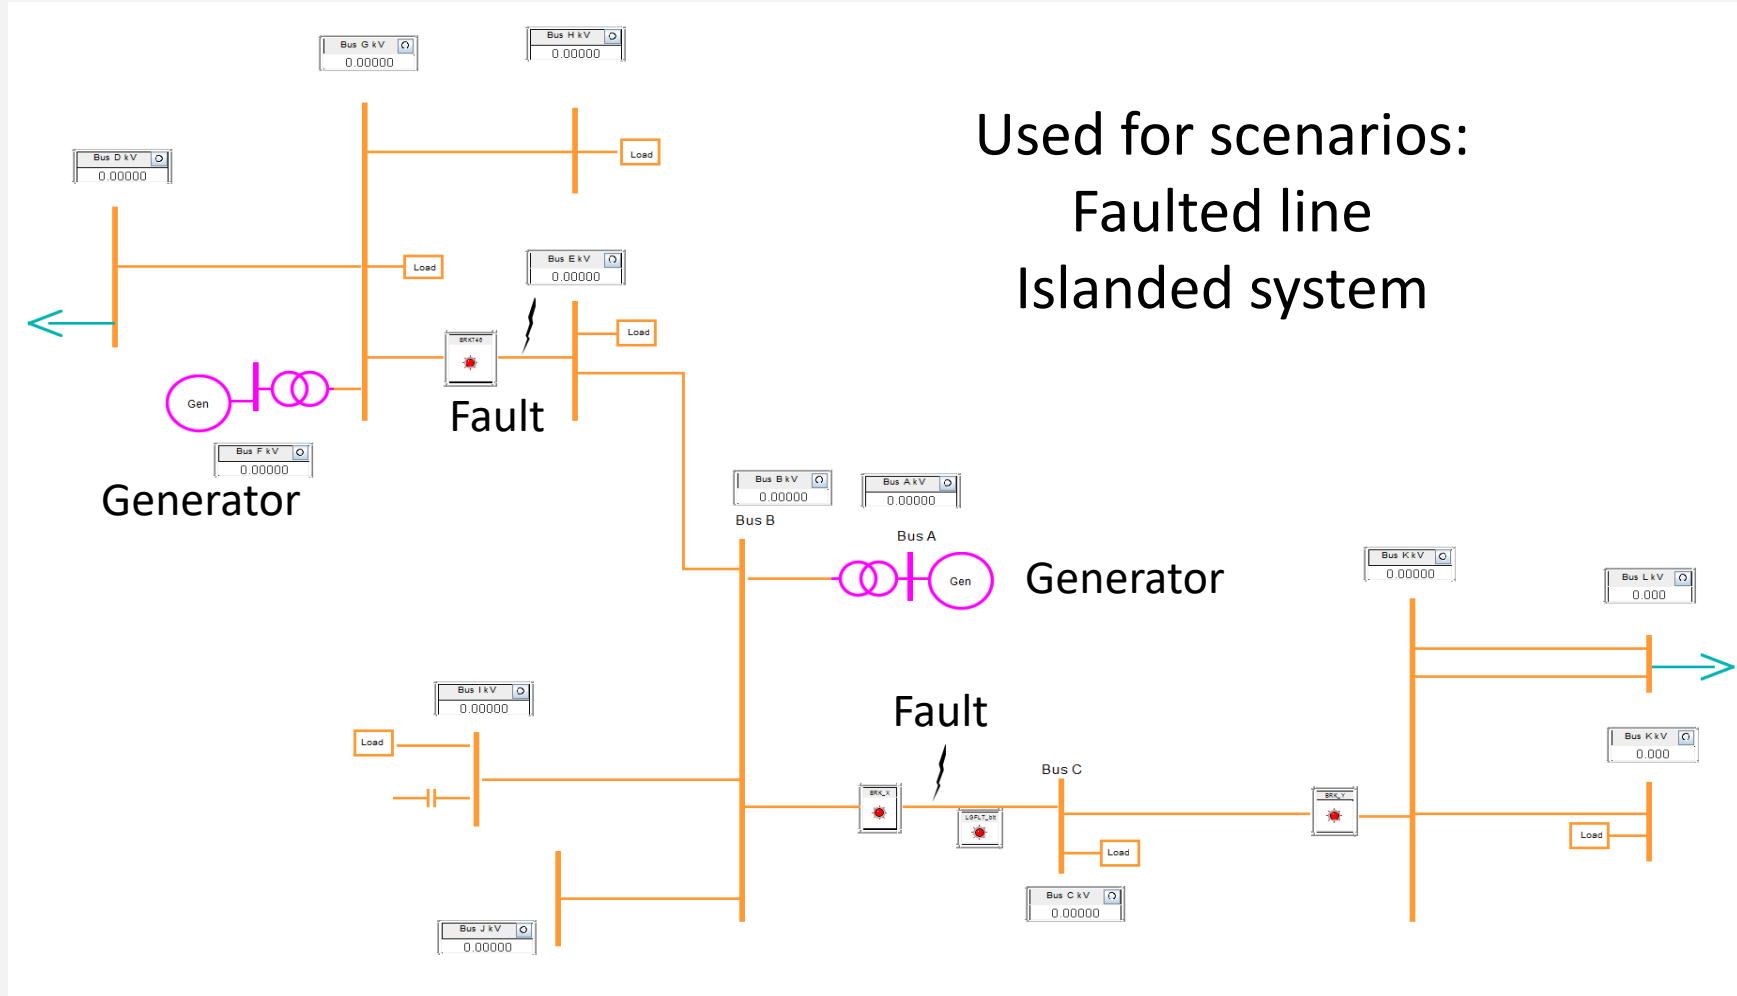

- Conditions
 - Faulted line
 - Islanded system
 - Lost load
- Operator actions demonstrated
 - Clear faulted line
 - Resynchronize islanded system
 - Restore load

Island Scenario

TRAINING MODEL: TRANSMISSION SYSTEM

Connection to system outside of study

Connection to system outside of study

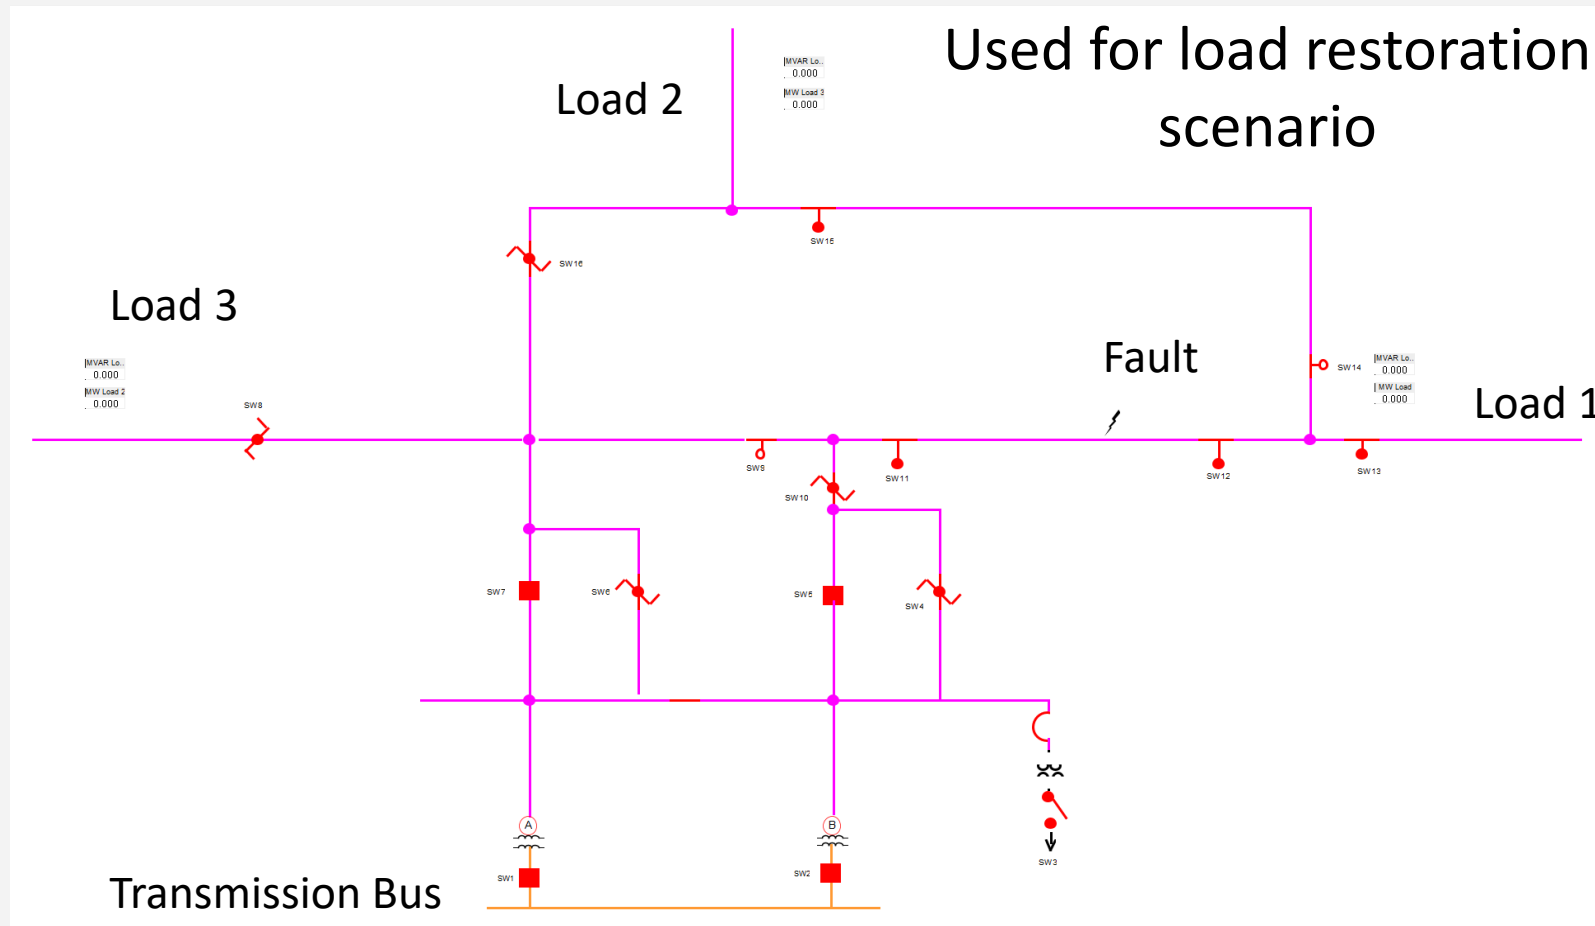

SCENARIO: FAULTED LINE

- Situation
 - Fault causes a set of breakers to trip a line
 - Fault persists on the line
 - One breaker recloses on the line
 - Remaining breaker will not close until the fault is cleared
- Required operator action
 - Identify location of fault and clear it
 - Reclose breaker to restore the line
- Takeaway
 - RTDS provides accurate system response to trainee's control actions

SCENARIO: ISLANDING

- Situation
 - Fault islands the system
- Required operator action
 - Recognize the event
 - Resynchronize the islanded system
 - Close breaker to reconnect islanded system
- Takeaway
 - RTDS facilitates intuitive controls to resynchronize island and restore system

TRAINING MODEL: SUB-TRANSMISSION SYSTEM

SCENARIO: LOAD RESTORATION

- Situation
 - Fault causes automated protection to trip
 - Load is dropped
 - Line is de-energized
- Required operator action
 - Find alternate pathway to restore load
 - Clear fault
 - Re-energize line
- Takeaway
 - Flexibility to build training simulations representing a wide variety of historical grid events

RESULTS

- Successfully demonstrated a variety of training simulations
- Internal team was impressed with the ability of RTDS to generate training scenarios
- The effort illustrated the following
 - Automated grid response to operator actions
 - Flexibility to create target scenarios based upon user needs
 - Recreated similar HMIs to native operator views

FUTURE STEPS

- Develop additional scenarios based upon internal training needs
- Improve dynamic performance of the system
- Further refine runtime views to reflect operator screens
- Explore cost effectiveness of training using RTDS versus other training methods
- Investigate the level of detail to appropriately represent study scenarios
