

2016 European User's Group Meeting

## WHAT'S NEW: SEPTEMBER 2016

Yunnan Luxi back-to-back HVDC project in China uses RTDS Simulator for control and protection testing

Introducing RSCAD V5—featuring a revamped compiler, and all-new Distribution Mode

### European UGM Highlights

The 2016 European User's Group Meeting was a huge success. Over 50 attendees from across Europe and around the world joined us at this event. This year's UGM featured 16 user presentations, an evening outing at a historical site on the bonnie banks of Loch Lomond (pictured above), and a technical tour of the world-class Power Networks Demonstration Centre. Thank you to all of our participants for joining us, and to the University of Strathclyde for hosting this great event!

### Upcoming Events

#### IFAC Workshop on Control of T&D Smart Grids - CTDSG'16

October 11-13, 2016  
Prague, Czech Republic

#### CIGRÉ Canada

October 17-19, 2016  
Vancouver, Canada

#### Niagara 2016 Symposium on Microgrids

October 20-21, 2016  
Niagara-on-the-Lake, ON

#### GCC Power 2016 (GCC CIGRÉ)

November 8-10, 2016  
Doha, Qatar

### GUEST ARTICLE

## RTDS Simulator used for complete control and protection system testing for the world's highest voltage and largest capacity VSC-based HVDC project

Guo Qi and Haiping Guo — China Southern Grid

On August 29, 2016, the Yunnan Luxi back-to-back VSC-HVDC project was officially put into operation. The project is located in Yunnan Province, Luoping County, China, and is the first ever back-to-back VSC-HVDC and LCC-HVDC parallel operated mode HVDC project in the world. The VSC-HVDC unit's capacity of 1,000 MW and  $\pm 350$  kV DC voltage also make it the largest capacity and highest voltage VSC-based HVDC project in the world.

The technical director of the project is SEPRI (Electric Power Research Institute, China Southern Power Grid), and complete testing of the project's control and protection system functionality, as well as dynamic performance testing (FPT/DPT), were accomplished using the RTDS Simulator.

The project's control and protection system consists of three parts: LCC-HVDC, VSC-HVDC, and coordinated control. The FPT/DPT was accomplished using the RTDS Simulator's GTFPGA Unit to simulate MMC valves using RSCAD's latest Generic Model for MMC valves. Each simulated leg contained up to 512 submodules, simulated at a time step of 2.5  $\mu$ s. Through an external file, different capacitance values for each submodule can be set, and bypass faults and capacitor open/short circuit faults can be set for any submodule. By using MMC simulation on the RTDS Simulator, the testing team minimized the possibility of HVDC control and protection system deficiencies, and guaranteed the reliability and availability of the system.

The LCC-HVDC and VSC-HVDC systems modelled in the RTDS Simulator's software, RSCAD

## Don't miss our upcoming webinar on September 28!

**STATCOM and Beyond: Exploring Real Time Power Electronics Simulation and CHIL Testing with the RTDS Simulator**

**Wednesday, September 28  
10:00 AM CST**

This exciting webinar will introduce you to the theory of modelling power electronics with the RTDS Simulator, the models available in the RSCAD software library, and the development and implementation of control systems in both the simulated and physical environments. Watch our live control-hardware-in-the-loop demo, where we'll show you how to implement a STATCOM controller on an out-of-the-box microcontroller development kit. Then we'll interface the controller with the simulation in a closed loop.

## 2017 Southern Africa User's Group Meeting

**February 2 & 3, 2017  
Cape Town, South Africa**

We are now accepting registrations and abstract submissions for our second annual Southern Africa UGM, hosted by the Cape Peninsula University of Technology! This event is open to all users, and to all power industry colleagues who are interested in real time digital power system simulation.

The smooth implementation of the project enhanced the overall security and stability of China's south main power grid and improved the delivery capacity of the Yunnan power grid. The project also helped to provide clean, inexpensive, green power to the Guangdong and Guangxi regions.

## Introducing RSCAD Version 5, featuring Distribution Mode and much more

RTDS Technologies is excited to announce the release of RSCAD Version 5. This new version of the RSCAD software offers many new advantages to users of the RTDS Simulator. Most notably, V5 runs on an entirely overhauled compiler, and features Distribution Mode, which allows users to simulate distribution feeders with over 1000 interconnected nodes on a single rack.

RSCAD V5 also includes a new feature for streaming IEC 61850-9-2 Sampled Values from the RTDS Simulator via dedicated FPGA-based hardware. GTFPGA-SV can output up to 16 Sampled Values data streams simultaneously.

To learn more about RSCAD V5, visit our website or read the excerpts from the release notes below.

## What's new in RSCAD V5

**RSCAD V5 is compatible with racks containing PB5 and/or GPC Processor Cards only.**

- The RTDS compiler has been revamped by our software development team, which will make it easier to maintain and enhance RSCAD's capabilities moving forward.
- Distribution Mode allows users to simulate a distribution network with several hundred to a thousand nodes in one tightly coupled area.
- The GTFPGA-SV component allows the output of many simultaneous IEC 61850 Sampled Values data streams via the GTFPGA Unit hardware. Both IEC 61850-9-2LE and IEC 61869-9 modes are available.
- The number of variables that can be communicated over the backplane has been increased from 1000 to 2000.
- A number of hard limits have been removed (G-matrix overlays, current injections, switches per network solution, and more). Limits still exist in V5, but depend on available resources rather than fixed hard limits.
